Practical Example Breakdown

Let's consider a hypothetical question from the ERR workbook:

Question:

"Calculate the fair value of a bond with a 5-year maturity, a coupon rate of 4%, payable annually, and a yield to maturity (YTM) of 3%."

ERR Workbook Answer Breakdown:

Step 1: Restate the problem

Calculate the bond's fair value given the coupon rate, maturity, and YTM.

Step 2: Use the present value formula for bond valuation

Bond value = Present value of coupons + Present value of face value.

Step 3: Calculate present value of coupons

PV of coupons = $C \times [1 - (1 + YTM)^{-n}] / YTM$

Where C = annual coupon payment = 4% of face value (assume face value = 1000 for simplicity) = \$40

n = 5 years

YTM = 3% = 0.03

PV of coupons = $40 \times [1 - (1 + 0.03)^{-5}] / 0.03$

Step 4: Calculate present value of face value

PV of face value = Face value / $(1 + YTM)^n = 1000 / (1 + 0.03)^5$

Step 5: Sum the present values

Step 6: Final answer

Calculate numerically to obtain the fair value.

Insights:

- Recognize that since the coupon rate exceeds YTM, the bond trades at a premium.
- Be cautious with calculation accuracy? small errors can lead to significant differences.

Common Errors:

- Using the wrong discount rate
- Confusing coupon payment calculations
- Forgetting to discount the face value
